Project 2: Automatic Data Carver using Python

Name: **Roshan Nellore Prasad**

Worked with: Shefali Athavale

Approach:

For this project, we wrote an Automatic Data Carver Program using Python. We used the following libraries for the same - sys, re, os, hashlib. The program asks the user to enter a file through the command line which is to be carved. It is assumed that the file will be a binary file. Two dictionaries are created for storing SOF and EOF signatures for JPEG/JPG, PNG and PDF files. Once the user enters the file, the program searches for Start of File (SOF) and End of File (EOF) offsets and stores them in lists. There are separate lists for SOF and EOF offsets according to the file types. Once we get the SOF and EOF offsets for the above file types, we carve the files and store it in the following format - 'carved_1.jpeg', 'carved_2.png', 'carved_3.pdf', etc. The program is tested on 'midterm.dd' and 'carve.lab' files. MD5 hash of all the carved files is also calculated to check if the files carved by the program match the files carved manually. The program outputs basic file information like the file name, file type, SOF and EOF offsets in bytes, File size and the MD5 hash of the file. The MD5 hashes are also stored in a file called 'hashes.txt'. All the carved files and the file 'hashes.txt' are stored in a directory titled by my last name "Nellore Prasad". The output is attached below

Output:

For **Midterm.dd**

```
